

# Asking Questions and Predicting

## How scientists question and predict

### Notice a pattern

We spot something that happens again and again.

### Ask a question

We wonder why or how, like 'What will happen if...?'

### Make a prediction

We use what we know to guess what might happen.

### Check it out

We watch or test to see if we were right.

## TEACHER TALK - WONDER AND PREDICT

Model curiosity: notice something, ask a question, then predict. Explain that a prediction is a smart guess based on what we already know or have seen before.
